

ARYAN ZAVERI

Quant Developer | Trading Systems | Research Infrastructure | Execution

LinkedIn: <https://www.linkedin.com/in/aryan-zaveri0401/>

GitHub: <https://github.com/Aryan040101/aryan-zaveri>

SUMMARY

Quant Developer focused on end-to-end trading infrastructure: market data, cross-asset research, backtesting, replay, risk decisions, order managers and execution analytics. Python for research/backtesting; C++ for live socket, risk and order-runtime components; JSON contracts, Redis hot state and PostgreSQL persistence.

SKILLS

Languages: Python, C++, SQL, Shell, JavaScript

Systems: Linux, AWS, Git, Docker, WebSockets, REST APIs, broker/exchange APIs, JSON contracts

Data: Redis streams/hashtables, PostgreSQL, SQLite, market data archives, candles, Greeks, snapshots, analytics outputs

Quant: feature engineering, cross-asset research, backtesting, walk-forward validation, replay, risk managers, order managers, execution journals

Markets: equities, futures, options, crypto; Indian/global sectors, oil, FX, macro, volatility and breadth/regime context

WORK EXPERIENCE

GreyOak Capital - Quantitative Developer | Mar 2026 - Present

- Build quantitative research systems, market-intelligence infrastructure, market-data services and analyst-facing context-intelligence tooling.
- Work on Horizon, Compass, Context-Intelligence and Ask-GreyOak style systems connecting market context, internal data flows, dashboards, WebSocket/data contracts and research interfaces.
- Own research-to-runtime handoffs across historical archives, live state, signal outputs, runtime logs, validation reports and production-readiness workflows.

KIFS Trade Capital - Quantitative / Algorithmic Trading Developer | 2024 - Mar 2026

- Built algorithmic trading tools, broker/API workflows, intraday market-data processing, conversion/reversion research utilities and execution analytics.
- Developed intraday/options analytics around tick/depth context, price action, option-chain features, IV/OI/Greeks-style inputs, signal filters and post-market validation.
- Worked on order lifecycle mechanics, execution constraints, latency-aware design and reusable net-PnL evaluation modules for trade-quality analysis.

Greeksoft Technologies - Algorithmic Trading Intern

- Worked around broker-facing algorithmic trading platform workflows: broker connectivity, instrument mapping, market data, order placement, order status and execution flow.
- Gained practical exposure to how broker APIs, authentication, market-data subscriptions and order-state transitions fit inside an algo-trading platform.

TECHNICAL HIGHLIGHTS

- Live runtime: C++ socket handlers, risk managers, order managers, queueing, heartbeats, working-order state and replayable execution journals.
- Data/state: Redis streams and hashes for hot state; PostgreSQL writers for candles, instruments, Greeks, snapshots and analytics; durable writes outside the hot path.
- Execution quality: preflight checks, stale-quote rejection, spread/slippage gates, replace/adjust loops, laddering, fill/reject journals and replay analytics.

SELECTED PROJECT - VAJRA

- Built a personal multi-asset research/trading platform connecting Indian sectors, global indices, crude oil, FX, macro context, options/futures structure and crypto risk appetite.
- Implemented the research-to-execution loop: market data archive, feature engineering, signal ranking, risk decision, order intent, execution journal, replay/PnL analytics and model refinement.
- Separated Python research/backtesting from C++ live runtime: socket handlers, risk-manager/order-manager components, execution state, JSON contracts and lifecycle journals.
- Designed Redis hot state for queues, streams, positions, working orders and heartbeats; PostgreSQL writers for durable candles, instruments, Greeks, snapshots and analytics outputs.
- Built independent risk authority for global capital, segment risk, side/symbol exposure, active-order limits, quote freshness, drawdown controls and hard exits.
- Worked on adaptive execution: preflight checks, stale-quote rejection, spread/slippage gates, price leaning, replace/adjust loops, laddering, take-profit, stop-loss and trailing exits.

EDUCATION

B.Tech Information Technology, MPSTME.
